However, the saje working load oj neither the concrete nor the steel must be exceeded. The working strengths of the concrete given in column (4) appear high, but by comparing the factors of safety corresponding to various ultimate strengths, as given in columns (9) to (14) with the average values of the strength of concrete at one and six months in the table on page 242, and also with the results of actual tests, also given in Chapter XIII, it is evident that ample allowance has been made for ordinary conditions. If a larger or smaller factor of safety is required, the value of K can be readily calcuated or obtained by interpolation or exterpolation. Various combinations of the modulus of elasticity, compressive strength of concrete, and tensile strength of steel are presented, so that the calculator may select those which correspond to the materials he is to use and which are adapted to the character of the structure. In cases where the work is not of sufficient importance to warrant making special tests or examinations of the materials, the tables on pages 313, 317, and 318 may be employed directly. The method of using the general table on page 302 is illustrated in examples 1 to 9. EXAMPLES OF BEAM AND SLAB DESIGN The following examples illustrate the methods of computing moments of resistance and dimensions of simple beams and slabs. Examples 1 to 9 are from the general table on page 302, and...
